

Albert drove from point A to point B, a distance of 120 miles. Bruce also drove from point A to point B, but departed from point A 10 minutes after Albert did. They drove along the same road, and there was no traffic on their way.

Bruce arrived at point B ten minutes later than Albert. But on Bruce's car dashboard the total distance driven was 1 mile less than the distance on Albert's car dashboard.

How can that be?
